

M15 Quick Reference

Fabric engineering decisions, validation and evidence truth

REVISION | NOT A SUBSTITUTE FOR PRACTICE

Fabric object/state quick map

OneLake / Lakehouse

Durable data state. Files and managed Tables are different contracts.

Notebook / Spark

Compute/transform. Rerunnable code must not rely on hidden session state.

Pipeline / Copy job

Orchestration vs simpler movement/incremental patterns. Failure routing and state progression matter.

SQL endpoint / Warehouse

Serving choices differ by write/ownership/workload contract.

Runtime and evidence truth

Runtime authority

Record the actual runtime visible to you.

Evidence labels

LIVE FABRIC = actual execution. OFFLINE PLAN = design only. SIMULATOR = local deterministic control.

Never do

Do not call a documentation screenshot, planned object, or local simulator a live Fabric run.

Validation and recovery

Data

State grain, key, row counts, bad-row handling, totals and rerun behavior.

Security

Minimum permission, intended identity, expected denied action, no plaintext secret.

Operations

Run/freshness/business controls, alert -> diagnosis -> recovery -> post-recovery validation.

Incremental

Advance progress only after durable publish; exact rerun must be safe.

Mastery + route

Mastery

All required competencies demonstrated; zero unresolved critical failures; explain design without copying.

Repair

saved attempt -> targeted repair -> changed proof -> validation -> reassessment.

Route

M15 -> M16 -> M17 -> G06 Gate A. G06 B/C remain remediation-only if assigned.
