

M15 -> M16 Handoff

Carry evidence forward; G06 remains after M17

ROUTE CONTROL

Correct next step

Route

M15 mastery -> M16 DataOps / CI-CD / Security / Observability.

Do not jump

G06 is after M17, not immediately after M15.

Carry forward

Bring cloud evidence labels, least-privilege reasoning, pipeline failure semantics, monitoring signals, environment separation and rollback thinking into M16.

What M16 assumes

Assumed

You can reason about Fabric items/state and distinguish live execution from plan/simulation.

Not assumed

You do not need to have purchased a certification or have permanent paid Fabric capacity.

Still pending

Any live cloud proof you could not execute remains explicitly pending; do not backfill fake evidence.

G06 later handoff

Gate input

M15 + M16 + M17 evidence -> G06 Gate A.

State machine

A is the only normal attempt. A clean pass ends the family. B/C open only after failed prior attempt, targeted repair and explicit assignment.

No shortcut

No numeric percentage can compensate for a missing required competency or critical failure.
