

M18 PORTFOLIO PUBLICATION & DEFENSE

Publish safely, defend technically, route to M19

THE PROJECT LEARNING LOOP

- Orient before building.
- Create learner-owned work.
- Validate independently.
- Preserve failures and changed retries.
- Separate static from runtime truth.
- Route M18 -> M19 -> G07.

BEGINNER-FIRST PROFESSIONAL INSTITUTE REBUILD

Build -> prove -> break -> repair -> rerun -> defend. No solved portfolio project is supplied.

This book is your teacher

Purpose

Turn real M18 evidence into a public portfolio story and technical defense without leaking secrets/protected controls or pretending static work was live cloud execution.

Repository/readme story

Order

Problem -> business user -> sources/grain -> architecture -> how to run -> validation -> changed/failure test -> recovery -> evidence index -> limitations/runtime truth.

Keep technical

Name exact invariants, grain/cardinality/state/recovery controls. Do not replace engineering proof with decorative screenshots.

Safe publication

Remove

Credentials, tokens, PII, private endpoints, protected expected-control files, and sealed incident solutions.

Keep

Sanitized diagrams, code you authored, reproducible instructions, non-sensitive sample data if allowed, validation summaries, and clearly labeled static/runtime evidence.

Interview defense

90 seconds

Goal -> source/grain -> architecture -> strongest correctness control -> incident/recovery -> trade-off -> runtime truth.

Deep-dive questions

Why this tool? How does rerun behave? Where can fan-out occur? How do you reconcile? What blocks publish? What happens on partial failure? What did you not execute?

M19 handoff

Next

After CAP-12 and portfolio evidence freeze, continue to M19 DE19-01. Use M18 artifacts as the interview-story source of truth.

Not yet G07

G07 comes after M19. Do not mark final job-ready practical complete from M18 alone.
