

G02 Review C - Protected

OPEN ONLY AFTER THE MATCHING GATE ATTEMPT HAS BEEN SAVED

This Review is diagnostic, not a copyable solution. It gives objective controls, critical-pattern checks and changed repair prompts. If Review helps you repair an answer, the repaired original is learning evidence; mastery requires a fresh changed proof.

Objective control panel

Control	Expected
Entity rows	6
Fact rows	14
Event rows	18
Exception rows	2
Raw fact LEFT JOIN event rows	20
Normalized raw categories	CORE, PLUS, PRO
NULL owner rows	3
Paid rows in 2026-08-21..2026-08-25	7
Entities with >= 2 Paid rows	3
Total Paid rows	10
Total Paid net_value	17,013.50
PostgreSQL transaction rows	8
PostgreSQL Settled rows	6
PostgreSQL Settled amount	10,250.00

Integrated expected controls by group

Market	Eligible count / net	Exceptions / events	Top eligible (deterministic)
East	3 / 5,020.50	1 / 7	I313 / 1,800.00
North	2 / 3,440.00	0 / 3	I307 / 1,890.00
South	3 / 5,178.00	0 / 3	I312 / 1,800.00
West	2 / 3,375.00	1 / 5	I302 / 1,760.00

Critical-pattern diagnosis

- K1/K2: population is wrong because Boolean precedence/date boundary/NULL handling changed eligibility; grouped result uses wrong HAVING level; derived categories hide source NULL or overwrite raw text.
- K3: one-to-many event join multiplies fact money; DISTINCT hides duplicate rows rather than fixing the grain; UNION silently removes legitimately distinct source events when UNION ALL was required.
- K4: CTE grain is unstated; ROW_NUMBER/RANK order can tie with no deterministic second key; latest/top logic cannot be reproduced.
- K5: one final total does not reconcile to an independent source-level control; event/exception metrics are joined before pre-aggregation and multiply each other.
- K6: invalid test data is made to pass by weakening a constraint; a transaction test remains committed; EXPLAIN claims speed without runtime evidence; normal view is described as a cached copy.
- K7: Review was opened before the attempt was saved, prior Gate SQL was copied, or the explanation cannot defend the actual result/control path.

Targeted changed repair menu

If weak	Changed repair proof
K1	Change the date window to one day outside the Gate request and prove your AND/OR/NULL logic still selects only the intended rows. Save count + 5-row inspection.
K2	Use a different normalization case rule and a new CASE threshold; then group by account_id and change HAVING from >= 2 to >= 3. Validate independently.
K3	Join only a different event subset to invoices; predict raw row multiplication before running, then produce a fact-grain result without DISTINCT. Build a changed UNION ALL stream.

If weak	Changed repair proof
K4	Rank the second-highest eligible record per Market with invoice_id descending as the tie-break instead of ascending; then use LAG on a different event timeline and validate the previous-event sequence.
K5	Rebuild one row per Market for a changed status/population and reconcile money/events/exceptions via three independently aggregated stages.
K6	ROLLBACK a different PostgreSQL row change; test a different constraint failure; compare EXPLAIN for a different filter; create a second small view at entity grain.
K7	Give a new 90-second explanation without the Review open and point to the saved SQL/control evidence for each claim.

Routing after repair

Record each changed repair as a new evidence row. If all previously weak competencies are now demonstrated and the reviewer does not require a full reassessment, the Gate family can pass without exposing the next sealed Gate. If a full fresh reassessment is justified, explicitly assign the next Gate variant. Never erase the original attempt.
