

G05 Review A — Protected

LOCKED UNTIL GATE A ATTEMPT IS SAVED.

This Review is diagnostic. It gives objective controls and repair directions, not a copyable full implementation.

Objective controls

Control	Expected
Accepted/quarantined batch rows	7 / 2
Accepted value total	119.5
Small files → compacted	9 → 3
Good join vs deliberate fan-out	7 → 9
Delta MERGE updates/inserts	1 / 1
Delta rows/value after merge	8 / 142.5
Idempotent Delta rerun	True
Stream input / unique event IDs	8 / 7
Restart processing attempts / unique side effects / suppressed	10 / 7 / 3
Total lag	6
Idle consumers	1
Additive schema change	True
Drop required field compatible?	False

Targeted repair menu

Weak area	Fresh changed proof
K1	Use a changed file-layout decision: alter partition cardinality or file count, recompute expected file sizes/counts, and justify a new compaction rule.
K2	On changed input, predict partition count before/after repartition/coalesce, show one plan, and explain the first shuffle boundary without copying prior notes.
K3	Use a changed dimension/data distribution. Prove key uniqueness, detect fan-out, reconcile value total, and propose/validate one skew/performance repair.
K4	Use changed update IDs/values. Prove update vs insert counts, version progression, idempotent rerun and one old-vs-new record without reopening this Review.
K5	Redefine Bronze/Silver/Gold for a changed business rule and write one maintenance/debug runbook that preserves raw evidence.
K6	Change partition count/consumer count. Recompute assignment/idle-consumer expectation, replay from a different committed position and prove idempotent side effects.
K7	Inject a different crash/lag/checkpoint condition. Recover, reconcile, preserve the failed attempt, then defend the exact state boundary in 90 seconds.

Routing

Preserve the original attempt. Close Review after diagnosis. Complete only the assigned changed repair/retry. Gate B/C remain sealed unless the Mentor explicitly assigns a fresh full reassessment.
