

G06 Review B - PROTECTED

OPEN ONLY AFTER A GENUINE SAVED GATE ATTEMPT. This is diagnosis/repair, not a solution template.

First compare your objective source profile and final controls. If these differ, fix evidence/reconciliation before debating architecture.

Protected control	Expected
Source rows	9
Distinct IDs	8
Accepted rows	6
Quarantined rows	3
Accepted value	1585.00
Duplicate IDs	R205
PII rule	raw person_email must not appear in serving/public evidence; mask or exclude
Freshness SLA	60 minutes
Incident	CI passed but a permissive role exposed raw PII to an analyst group

Competency diagnosis and changed repair

K1: Change one constraint (freshness, sensitivity, scale or managed-service restriction) and redesign only affected architecture choices.

K2: Change the incremental/watermark or serving requirement and rewrite the evidence/reconciliation plan without copying the first design.

K3: Inject a new CI/data failure. Define which test blocks promotion, what environment remains safe and how rollback is validated.

K4: Change the consumer role or PII exposure. Redesign masking/access/secret handling and prove the new least-privilege boundary.

K5: Use a different stale-data/credential/deployment incident. Write detect-contain-recover-validate-communicate steps and one cost/IaC safeguard.

K6: Change scale/cost/reliability assumptions. Revisit batch/streaming, managed/build or warehouse/lakehouse decision and reject two alternatives.

K7: Redo the defense on the changed scenario with explicit runtime truth and one justified promotion-foundation concept; no buzzword-only answer.

Retry rule

Close this Review before any fresh retry. Preserve the failed attempt. Gate B/C is a changed full reassessment only when explicitly assigned; copying these controls or wording cannot satisfy it.
