

G07 Gate A - ParcelPulse Fulfillment

NORMAL FINAL ATTEMPT

Standalone Zero-to-Job-Ready Data Engineer 2026 | G07

Assessment boundary

No tutorial, protected Review, answer key, AI solving or another learner solution may be open during the first attempt.

Scenario

Entity: shipment; party: customer; service level: daily by 08:00; source may redeliver files. Sensitive field: customer email is PII.

Required sequence

- Inventory sources and preserve lineage/checksums.
- Implement deterministic latest-state logic and explicit accept/quarantine rules.
- Publish PII-safe serving output and reconcile source/latest/accepted/quarantine/settlement controls.
- Rerun identical raw inputs and prove idempotent logical result.
- Inject the supplied incident only after baseline evidence is saved; diagnose and recover safely.
- Apply the supplied change request; predict its effect before run, then revalidate.
- Explain orchestration/storage/distributed/streaming/cloud/security/observability/cost translation.
- Give a separate defense of one M18 project and reference M19 interview/technical-English evidence.
- Complete a new evidence JSON from evidence_template.json.

Critical failures

- Silent wrong trusted data or unresolved reconciliation mismatch.
- Unsafe rerun/recovery that can duplicate/corrupt state.
- Secret/PII exposure or fabricated runtime/experience evidence.
- Cannot explain own implementation/design or cannot produce inspectable evidence.

Completion

The evidence checker validates structure only. Human technical review decides whether K1-K8 are actually demonstrated. No numeric score can compensate for a failed critical competency.
