

M00 Protected Repair Pack

After-attempt remediation only; preserves original attempts

Protected use

Open only after a saved weak/failed attempt. Diagnose the weakness; do not copy a finished task into the old attempt.

R01 Paths

Ask: what exact folder am I in, what is the full path, and does the target exist there? Recreate the path from drive -> folders -> file.

R02 Extensions

Separate file identity from default app. Rename is not conversion. Turn extensions visible and inspect the real suffix.

R03 ZIP/source copies

Keep source archive unchanged. Extract to normal files. Copy preserves original; move changes location.

R04 Installation

Verify official source, expected product, version and launch. Do not install unrelated future-module tools.

R05 VS Code

Check the Explorer root first. If wrong, File -> Open Folder and choose the project root. Save to a real path.

R06 Terminal

Run pwd first. Then ls. Only after you know location should you cd or mkdir. Avoid destructive commands.

R07 Troubleshooting

Write symptom -> hypothesis -> one change -> retry -> observed result. Do not change five variables.

R08 Evidence

Attempt stays frozen. Review is explanation. Retest is a changed task. Mastered requires fresh independent evidence.
