

M17 Protected Review & Repair

Open only after a genuine saved independent attempt

Standalone DE 2026 canonical rebuild - module-level QA candidate

DE17-01 Review / Repair - From requirements to architecture

OPEN ONLY AFTER your independent attempt is saved.

What strong evidence shows

Strong work begins with measurable requirements and only then maps them to decisions. Tool names without freshness/recovery/security/cost constraints are weak evidence.

Repair protocol

1. Identify the smallest weak decision/evidence link. 2. Close Review. 3. Change one requirement/failure/scale/security/cost condition. 4. Rebuild only the affected part. 5. Preserve the original weak attempt. 6. Explain why the changed task requires a fresh decision.

Do not repair by copying this paragraph into your ADR. A changed case must still work.

DE17-02 Review / Repair - Batch vs streaming decisions

OPEN ONLY AFTER your independent attempt is saved.

What strong evidence shows

Strong work treats latency as a business requirement. Streaming is justified only where its lower latency is worth replay/ordering/state/operations complexity.

Repair protocol

1. Identify the smallest weak decision/evidence link. 2. Close Review. 3. Change one requirement/failure/scale/security/cost condition. 4. Rebuild only the affected part. 5. Preserve the original weak attempt. 6. Explain why the changed task requires a fresh decision.

Do not repair by copying this paragraph into your ADR. A changed case must still work.

DE17-03 Review / Repair - Warehouse vs lakehouse

OPEN ONLY AFTER your independent attempt is saved.

What strong evidence shows

Strong work states truth ownership. Warehouse/lakehouse choices follow workload and consumer needs; “both” needs explicit boundaries to avoid duplicate truth.

Repair protocol

1. Identify the smallest weak decision/evidence link. 2. Close Review. 3. Change one requirement/failure/scale/security/cost condition. 4. Rebuild only the affected part. 5. Preserve the original weak attempt. 6. Explain why the changed task requires a fresh decision.

Do not repair by copying this paragraph into your ADR. A changed case must still work.

DE17-04 Review / Repair - Managed service vs build yourself

OPEN ONLY AFTER your independent attempt is saved.

What strong evidence shows

Strong work compares total operational responsibility. A free/self-hosted license can still be expensive when patching, upgrades, on-call and backup are yours.

Repair protocol

1. Identify the smallest weak decision/evidence link. 2. Close Review. 3. Change one requirement/failure/scale/security/cost condition. 4. Rebuild only the affected part. 5. Preserve the original weak attempt. 6. Explain why the changed task requires a fresh decision.

Do not repair by copying this paragraph into your ADR. A changed case must still work.

DE17-05 Review / Repair - Scaling and bottleneck reasoning

OPEN ONLY AFTER your independent attempt is saved.

What strong evidence shows

Strong work names the measured bottleneck before the scaling action and defines a repeatable load/metric to prove improvement.

Repair protocol

1. Identify the smallest weak decision/evidence link. 2. Close Review. 3. Change one requirement/failure/scale/security/cost condition. 4. Rebuild only the affected part. 5. Preserve the original weak attempt. 6. Explain why the changed task requires a fresh decision.

Do not repair by copying this paragraph into your ADR. A changed case must still work.

DE17-06 Review / Repair - Reliability and failure domains

OPEN ONLY AFTER your independent attempt is saved.

What strong evidence shows

Strong work names failure domain, blast radius, RTO/RPO, durable state, recovery action and post-recovery reconciliation. "HA" alone proves nothing.

Repair protocol

1. Identify the smallest weak decision/evidence link. 2. Close Review. 3. Change one requirement/failure/scale/security/cost condition. 4. Rebuild only the affected part. 5. Preserve the original weak attempt. 6. Explain why the changed task requires a fresh decision.

Do not repair by copying this paragraph into your ADR. A changed case must still work.

DE17-07 Review / Repair - Cost-aware architecture

OPEN ONLY AFTER your independent attempt is saved.

What strong evidence shows

Strong work identifies cost drivers/guardrails and protects the business SLO. Cheapest is not automatically cost-optimized.

Repair protocol

1. Identify the smallest weak decision/evidence link. 2. Close Review. 3. Change one requirement/failure/scale/security/cost condition. 4. Rebuild only the affected part. 5. Preserve the original weak attempt. 6. Explain why the changed task requires a fresh decision.

Do not repair by copying this paragraph into your ADR. A changed case must still work.

DE17-08 Review / Repair - Security and governance by design

OPEN ONLY AFTER your independent attempt is saved.

What strong evidence shows

Strong work follows sensitive data through identities, permissions, protection, lineage, retention and audit boundaries.

Repair protocol

1. Identify the smallest weak decision/evidence link. 2. Close Review. 3. Change one requirement/failure/scale/security/cost condition. 4. Rebuild only the affected part. 5. Preserve the original weak attempt. 6. Explain why the changed task requires a fresh decision.

Do not repair by copying this paragraph into your ADR. A changed case must still work.

DE17-09 Review / Repair - Promotion foundations: CDC, Contracts, Vault, Mesh, Kubernetes

OPEN ONLY AFTER your independent attempt is saved.

What strong evidence shows

Strong work can reject advanced technology. CDC/contracts/Vault/mesh/Kubernetes are mastered here when you can explain problem, tradeoff, use trigger and no-use trigger.

Repair protocol

1. Identify the smallest weak decision/evidence link. 2. Close Review. 3. Change one requirement/failure/scale/security/cost condition. 4. Rebuild only the affected part. 5. Preserve the original weak attempt. 6. Explain why the changed task requires a fresh decision.

Do not repair by copying this paragraph into your ADR. A changed case must still work.

DE17-10 Review / Repair - Architecture review and defense

OPEN ONLY AFTER your independent attempt is saved.

What strong evidence shows

Strong defense links requirement -> decision -> alternative -> tradeoff -> failure/recovery -> validation and changes one decision when a constraint changes.

Repair protocol

1. Identify the smallest weak decision/evidence link. 2. Close Review. 3. Change one requirement/failure/scale/security/cost condition. 4. Rebuild only the affected part. 5. Preserve the original weak attempt. 6. Explain why the changed task requires a fresh decision.

Do not repair by copying this paragraph into your ADR. A changed case must still work.
