

G03 Gate A

Zero-to-Job-Ready Data Engineer 2026 | Protected assessment RC1

Protected Gate conditions

Learner book, review files, AI solving and tutorial/web solution hunting are closed. Use only the Gate brief, supplied Gate data and explicitly permitted command/reference help.

Scenario

ParcelPulse: a courier team has a small Python CSV validator that must be operated from Linux, version-controlled and handed off safely.

Required build / evidence

1. Work in a declared Linux project path and preserve the supplied raw CSV.
2. Implement/repair Python validation so invalid amount/status rows are rejected with reasons and the process exits non-zero on an unrecoverable contract failure.
3. Add pytest or equivalent tests for at least two validation rules.
4. Create a Git repository with purposeful commits, a feature branch and a deliberate merge conflict that is resolved correctly.
5. Use environment-driven configuration with a fake `.env.example`; prove local `.env` and `.venv` are untracked.
6. Create a run script that stops on Python failure and captures useful output without logging secrets.
7. Publish through a pull-request workflow, review the intended diff and synchronize main after merge.
8. Produce a clean-clone reproduction and README with setup/run/validate/rerun/limitations.

Pass standard

No unresolved critical failure. Correctness, integrity, reliability and reproducibility must be demonstrated with saved evidence; a high average cannot hide silent wrong data or secret exposure.
