

G03 Fresh Gate B

Zero-to-Job-Ready Data Engineer 2026 | Protected assessment RC1

Protected Gate conditions

Learner book, review files, AI solving and tutorial/web solution hunting are closed. Use only the Gate brief, supplied Gate data and explicitly permitted command/reference help.

Scenario

FarmLedger: a farm-coop receives inventory movements and needs a reproducible Python/Linux repository after a teammate introduced a bad commit.

Required build / evidence

1. Profile the supplied movement CSV from the shell before coding.
2. Build a Python summarizer with validation, logging and non-zero failure behavior for malformed schema.
3. Recover the supplied bad committed change without destructive shared-history rewriting.
4. Create and resolve a fresh conflict in a documentation/config file.
5. Keep generated logs, .venv and local fake secret file out of Git while versioning .env.example.
6. Use a branch + PR, merge, synchronize main and prove clean repository status.
7. Reproduce from a clean directory and document evidence/known limitations.

Pass standard

No unresolved critical failure. Correctness, integrity, reliability and reproducibility must be demonstrated with saved evidence; a high average cannot hide silent wrong data or secret exposure.
