

G03 Gate A Review

Zero-to-Job-Ready Data Engineer 2026 | Protected assessment RC1

Review after attempt only

A strong attempt must preserve the stated grain/identity, validate outputs independently, show safe failure/recovery behavior and provide reproducible evidence. If one competency fails, repair that skill then use a different fresh task - do not copy this review into the attempt.

Expected review principles

- Correctness: output row counts/reasons match the supplied input contract.
- Reliability: failing validation cannot print false SUCCESS or silently publish bad output.
- Git: branch/conflict/PR evidence shows intended final history and clean status.
- Security: no real secrets or environment folders are tracked.
- Reproducibility: clean clone runs from documented dependencies and commands.
