

G03 Gate B Review

Zero-to-Job-Ready Data Engineer 2026 | Protected assessment RC1

Review after attempt only

A strong attempt must preserve the stated grain/identity, validate outputs independently, show safe failure/recovery behavior and provide reproducible evidence. If one competency fails, repair that skill then use a different fresh task - do not copy this review into the attempt.

Expected review principles

- Fresh domain/data and a different repository incident must be solved independently.
- Published bad history should normally be corrected with a safe new commit/revert rather than erased blindly.
- Validation/logging exit behavior must be observable and reproducible.
- Repository hygiene and clean-clone proof remain critical.
