

G04 Fresh Gate B

Zero-to-Job-Ready Data Engineer 2026 | Protected assessment RC1

Protected Gate conditions

Learner book, review files, AI solving and tutorial/web solution hunting are closed. Use only the Gate brief, supplied Gate data and explicitly permitted command/reference help.

Scenario

MediSupply: supplier shipment updates include a corrected record, one bad schema file and an API page that fails once. Build a fresh pipeline and recovery proof.

Required build / evidence

1. Land all raw files/pages with checksums and run IDs.
2. Reject the breaking-schema batch before serving/state mutation.
3. Use PostgreSQL staging/serving keys and deterministic update logic for the corrected shipment.
4. Design orchestration with bounded transient retry but no retry loop for deterministic schema failure.
5. Prove same-batch rerun/replay does not duplicate serving rows.
6. Reconcile counts/keys/amounts and document the recovery sequence from the injected failure.
7. Provide Docker/Airflow execution notes plus clean project handoff.

Pass standard

No unresolved critical failure. Correctness, integrity, reliability and reproducibility must be demonstrated with saved evidence; a high average cannot hide silent wrong data or secret exposure.
