

G04 Gate A Review

Zero-to-Job-Ready Data Engineer 2026 | Protected assessment RC1

Review after attempt only

A strong attempt must preserve the stated grain/identity, validate outputs independently, show safe failure/recovery behavior and provide reproducible evidence. If one competency fails, repair that skill then use a different fresh task - do not copy this review into the attempt.

Expected review principles

- Every source row/key has an explainable landing/staging/target or quarantine outcome.
- PostgreSQL constraints and deterministic keys prevent orphan/duplicate serving records.
- Incremental/replay behavior is idempotent and checkpoint/state evidence is correct.
- Orchestration task boundaries allow targeted retry/recovery rather than one giant opaque task.
- Handoff can recreate and validate the pipeline.
