

Gate 6B - Cloud + Production Fresh Retest

Protected fresh retest | Municipal water-meter platform | RC1

Scenario

A municipality receives water-meter readings and account updates. The inherited platform has a different schema and different production risks, but the same engineering competencies must be demonstrated: reliable Fabric architecture, safe incremental processing, privacy, CI/CD, observability, recovery and cost-aware operations.

Your mission

- Find and rank the weak architecture risks in the fresh case.
- Design the Fabric/OneLake/Lakehouse target with clear Bronze-Silver-Gold ownership and SQL serving.
- Implement the fresh quality gate and privacy masking using the new meter/account schema.
- Define a fresh business key, watermark, merge and late-arrival strategy; prove rerun safety.
- Design least-privilege identity/RBAC and secret handling.
- Provide CI/CD, rollback, monitoring, runbook and Terraform/IaC evidence.
- Defend scale, reliability, cost and recovery trade-offs.
- Run the fresh checker and save evidence. Live Fabric execution remains mandatory before FINAL.

Protected rules

- No copying Gate 6A field names or outputs.
- Do not open Gate 6B Review until this retest is saved.
- No real secrets in files.
- Live Fabric runtime evidence remains separate from the offline checker.

Submission evidence

- Saved fresh retest
- Checker output
- Fresh architecture/risk/security evidence
- Fresh quality and masking outputs
- Fresh incident/runbook evidence
- Short defense
